Baseline numerical experiments

Two synthetic instances test implementation correctness and parameter sensitivity.

• Small case: independent exhaustive enumeration. Large case: annual-scale inputs and an independent dynamic-programming reference.

• Inputs are experimental assumptions and literature-informed proxies, not calibrated forecasts for actual cities.

Colab opens the original Drive notebook; the GitHub file is a saved snapshot. Sign in with an account that can access the original.

Folders

• large_case — Annual synthetic instance with three cities, ten demand scenarios, and a fleet limit of 1,000 vehicles.

• small_case — Three-city, ten-scenario instance for checking the MILP against exhaustive enumeration.
